

Project Development Phase

Functional & Performance Testing Template

Date	03 September 2026
Project Name	ServiceNow-Based Employee Laptop Request Application

Model Performance Test

The project is a ServiceNow-based employee laptop request workflow. Testing focuses on request form validation, yearly duplicate prevention, manager approval flow, status updates, notifications, and role-based access. Performance checks focus on normal request submission and workflow response.

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Employee request form validation	Open the laptop request form; enter valid and invalid mandatory values; submit.	Valid data is accepted; missing/invalid values are rejected with validation feedback.	To be recorded during execution.	Pending
FT-02	Laptop type and reason capture	Select Basic/Advance laptop type and enter the request reason; submit.	Selected laptop type and reason are stored with the request.	To be recorded during execution.	Pending
FT-03	Yearly duplicate prevention	Create a laptop request for an employee; attempt another request for the same employee in the same year.	Business Rule prevents the duplicate request according to project policy.	To be recorded during execution.	Pending
FT-04	Manager approval workflow	Submit a valid request and open the manager approval task.	Request is routed to the manager for approval/rejection.	To be recorded during execution.	Pending
FT-05	Status update	Approve or reject the request and review the request record.	Request status changes correctly and remains traceable.	To be recorded during execution.	Pending
FT-06	Notifications	Submit, approve, or reject a request and check configured notifications.	Relevant users receive the configured request/approval/status notification.	To be recorded during execution.	Pending
FT-07	Role-based access	Log in as employee and manager; try to access permitted and restricted functions.	Users can perform only actions allowed by their roles/ACLs.	To be recorded during execution.	Pending
PT-01	Request submission response time	Submit a valid request under normal load and measure response time.	Form submission completes without noticeable delay under normal expected usage.	To be recorded during execution.	Pending
PT-02	Workflow processing	Submit multiple valid requests and observe workflow processing and status updates.	Requests are processed without workflow failure or significant slowdown.	To be recorded during execution.	Pending
PT-03	Concurrent user load	Have multiple test users submit requests at approximately the same time.	Application remains responsive and requests are recorded correctly without crashes.	To be recorded during execution.	Pending

Testing note: Actual execution measurements and Pass/Fail outcomes were not supplied with the project materials, so they are intentionally marked as pending rather than invented.
